

HACKATHON PITCH

Claude **Factory**

How many Claudes are running right now?

Claude users run **many agents in parallel** — one per project, one per task. This dashboard shows the whole crew at a glance, as workers on a factory floor.

01 - THE PROBLEM

You can list them. But you **can't just glance.**

The official **Agent View** now lists every session in one table. But—

01

A table you visit

You have to open it and read the rows. The more focused you are, the less you bother.

02

State you can't feel

How many are waiting on you never jumps out. You miss the idle ones.

03

You won't leave it open

A purely functional screen isn't something you keep in view — so you end up not looking.

04

Idle burns money

Because you don't look, forgotten idle sessions keep eating resources.

What's missing is **a view you take in with a single glance.**

02 - THE SOLUTION

Claude Factory

See it at a glance

A live count of working / idle / total.

A factory metaphor

Each agent is a working Claude — busy ones move, idle ones sleep (zzz).

You'll want to look

A cute pixel factory you actually keep open.

03 - A FACTORY THAT CHANGES WITH THE DAY

Morning, evening, night — on Japan time

Morning — soft light through the windows

Evening — bathed in gold

Night — the ceiling lamps come on

Lighting shifts **continuously** with the real clock (JST). Sunlight through the windows and the ceiling lamps both change with the hour.

04 — WHERE WE STAND

The table is official. The view isn't — yet.

	Agent View (official)	Agent Quest	Claude Factory
Form	CLI table	2D village & heroes	Pixel factory
What you see	All session states (6)	Location by tool	Live count, busy / idle at a glance
Glanceability	△ a table you visit	○ a living village	◎ a view you leave open
What's unique	Official & accurate	Tool activity as place	JST day/night cycle + zero setup

It solves the same problem not with **features**, but with **ambience**
— how much you want to keep looking. That's Claude Factory.

05 - HOW IT WORKS

It just **reads local files**

✓ DONE — MVP shipped

Your running Claudes, made visible.

**Live status from real data —
busy/idle animation and real-time
updates, verified working.**

What's next — per-subagent counts / per-project production
lines / output gamification by uptime / a shared team view
